

**ABSTRACT:**

There are several shutter designs on the market today. The most popular types are louvered and paneled which we will use as examples discussed in this abstract.

The objective of this invention is to outline a reversible shutter which is designed to have one style on one side and have a completely different style on the opposite side for example, side A might be louvered and side B might be paneled.

The 2 main advantages of this invention are as follows:

- 1) Both the manufacturer and retailer will benefit from producing, warehousing and stocking fewer units without compromising availability.
- 2) The homeowner can now purchase a shutter that can be reversed for a completely different shutter look.
